

IN THE SPECIFICATION

Replacement paragraph for the paragraph beginning at Page 20 (Paragraph 61) and ending at Page 21, line 3:

During the product development phase, samples of the whole egg preparations were analyzed using the ELISA systems for "SB" Immunogen to monitor activity over time after the initial immunization schedule was completed. Selected animals from each group were placed into the production group. The average ELISA OD readings for the fourth through the sixth months are given in the table below. The eggs were sampled using $2501\mu\mu\text{l}$ of the whole egg and diluted 1:500 and 1:2,500 in PBS buffer and then run in the appropriate ELISA to determine the average OD reading at each dilution. The negative control readings are subtracted from each reading. The injected immunogens stimulated different responses in the animals along with good specificity.
